X: DTC P0133 O₂ SENSOR CIRCUIT SLOW RESPONSE (BANK 1 SENSOR 1)**1. OUTLINE OF DIAGNOSIS**

Detect time-lag of front oxygen (A/F) sensor response. Front oxygen (A/F) sensor cover has some ventilation holes for exhaust gas. Clogged ventilation holes are diagnosed. When the holes are clogged, the A/F output variation becomes slow comparing with the actual A/F variation because oxygen which reaches the zirconia layer is insufficient. Therefore, if the cover has clogged holes, the rich to lean judgment in ECM is delayed when the change from rich to lean is caused. Judge NG when the actual A/F variation is slow comparing with the ECM control amount.

GENERAL DESCRIPTION

4. GENERAL DRIVING CYCLE

Perform the diagnosis only once when fuel shut-off in deceleration after rapid acceleration in order to calculate the diagnostic value. (Pay attention to oxygen sensor voltage for the timing of deceleration.)

5. DIAGNOSTIC METHOD

When the rear oxygen sensor output voltage changes from 0.55 V (rich) to 0.25 V (lean), calculate the Min. value of response time regarded as judgment value while the output varies from 0.5 V to 0.3 V.

• Abnormality Judgment

Judge NG when the judgment value is larger than the threshold value after fuel shut-off in deceleration.

Response time (Diagnosis value) > Threshold value → Abnormal

Judge NG when the malfunction criteria below are completed in 2 seconds after the recovery of fuel shut-off in deceleration which requires 5 seconds or more. Judge OK when the malfunction criteria below are not completed regardless of the fuel shut-off in deceleration.

NOTE:

Variation time of rear oxygen sensor output voltage is short during fuel shut-off in deceleration. Carry out the NG judgment only after the fuel shut-off in deceleration. As for OK judgment, without the condition of fuel shut-off in deceleration, judge OK if the value is below the threshold value.

- Every time misfire (The same cylinder misfires every time.): FTP 1.5 times misfire, Catalyst damage misfire

The following detecting methods are adopted for these detection.

1) Intermittent misfire: FTP 1.5 times misfire

3. GENERAL DRIVING CYCLE

- Detecting misfire is able to be carried out in the condition between idling and high revolution; however, idling condition is better for detecting misfire from the viewpoint of engine load and damage.
- Perform the diagnosis continuously.

4. DIAGNOSTIC METHOD

EN-01773

- (A) Engine control module (ECM)
 (B) Diagnosis circuit
 (C) Crankshaft position sensor

When the misfire occurred, the engine speed is decreased and the crankshaft position speed will change. Calculate the interval difference value (diagnostic value) from crankshaft position speed by the following formula, and judge whether the misfire occurs or not comparing the calculated result with judgment value. Counting the number of misfire up, and if the misfire ratio is higher during 1,000 rev. or 200 rev., judge NG for the corresponding cylinder.

Calculate the diagnostic value (from crankshaft position speed)

- Misfire detection every single ignition (Compare diagnostic value with judgment value)
- 180° Interval Difference Method
 - 360° Interval Difference Method
 - 720° Interval Difference Method

- NG judgment (Judge misfire occurrence required by the law) (Compare number of misfire with judgment)
- FTP1.5 times misfire NG judgment
 - Catalyst damage misfire NG judgment

Diagnostic Trouble Code (DTC) Detecting Criteria

GENERAL DESCRIPTION

As the following figure, pick out a random cylinder as the standard and name it omg 0. And the former crankshaft position speed is named omg 1, the second former crankshaft position speed is named omg 2, the third is named omg 3, and the following is the same.

EN-01774

- (A) Ignition order
- (B) Crankshaft position speed

• 180° Interval Difference Method

Judge misfire occurs in the following cases.

- $\text{domg } 180 > \text{judgment value of positive side}$
- $\text{domg } 180 \leq \text{judgment value of negative side}$
(judgment value before 180°CA)

EN-01775

Diagnostic Trouble Code (DTC) Detecting Criteria

GENERAL DESCRIPTION

• 360° Interval Difference Method

Misfire judgment $\text{domg } 360 > \text{judgment value} \rightarrow \text{Misfire occurs}$

• 720° Interval Difference Method

Diagnosis value $\text{domg } 720 = (\text{omg } 1 - \text{omg } 0) - (\text{omg } 7 - \text{omg } 6)$

Misfire judgment $\text{domg } 720 > \text{judgment value} \rightarrow \text{Misfire occurs}$

Malfunction Criteria	Threshold Value
FTP emission judgment value	> 1.0% in 1,000 revs.

Malfunction Criteria	Threshold Value
Catalyst damage misfire judgment value	See Map 1

Map 1 Fault criteria threshold for misfire which would result in catalyst damage

EN-01778

These figures mean the misfire ratio (%) in 400 ignitions; for example, 22.5 (%) means 400 (ignition) × 22.5 (%) = 90 (ignition) or more, so this case is judged misfire.

GENERAL DESCRIPTION

EN-02873

In this system diagnosis, filter tank pressure is changed. And leakage and normality & abnormality of valve operation are judged by monitoring the pressure change status using the fuel tank pressure sensor. The diagnosis is performed for 0.04-inch diagnosis in the order of Mode A, Mode B, Mode C and Mode D. For 0.02-inch diagnosis, perform in the order of Mode Y, Mode A, Mode B, Mode C and Mode D.

0.04-inch Diagnosis

Mode	Mode Description	Diagnosis Period
Mode Z (Purge control solenoid valve open fail diagnosis)	Perform the diagnosis of purge control solenoid valve open fail depending on the magnitude of the tank pressure change after diagnosis started.	3 — 16 seconds
Mode A (Evaluation of EVAP. generation amount)	Calculate the tank pressure change amount (P1).	16 seconds
Mode B (Negative pressure sealed/large leak judgment)	Introduce the intake manifold pressure into the fuel tank. If the tank pressure cannot be reduced, diagnose that there is large leakage.	4 — 35 seconds
Mode C (Pressure increase check/premature OK judgment)	Wait until the tank pressure returns to the target value (Tank pressure when P2 calculation started). If the pressure does not return, perform the premature OK judgment.	4 — 15 seconds
Mode D (Negative pressure change amount measurement/EVAP. leakage diagnosis)	Calculate the tank pressure change amount (P2), and measure the diagnosis value using P1 calculated in Mode A. Perform the EVAP. leakage diagnosis using the diagnosis value.	12 — 16 seconds

GENERAL DESCRIPTION

2. COMPONENT DESCRIPTION

• Pressure Control Solenoid Valve

Pressure control solenoid valve maintains the fuel tank pressure equal to the atmospheric air pressure. Normally, the solenoid is set to OFF, and the valve mechanically opens and closes in accordance with the difference between the tank pressure and atmospheric air pressure, and the tank pressure and canister pressure.

The solenoid which is set to ON forces to open the valve.

• Drain valve

Drain valve controls the ambient air to be introduced to the canister.

EN-02293

Diagnostic Trouble Code (DTC) Detecting Criteria

GENERAL DESCRIPTION

• Tank Pressure Switching Solenoid

One of the fuel tank sensor control valve valves is connected to fuel tank pressure sensor and the other is released to atmosphere. The passage to fuel tank pressure sensor is usually released to atmosphere because the solenoid is set to OFF, but the solenoid which is set to ON closes the passage open to atmosphere.

EN-02195

- (A) Released to atmosphere (Solenoid OFF)
- (B) Ambient air
- (C) During diagnostics (Solenoid ON)
- (D) To pressure sensor
- (E) Plug

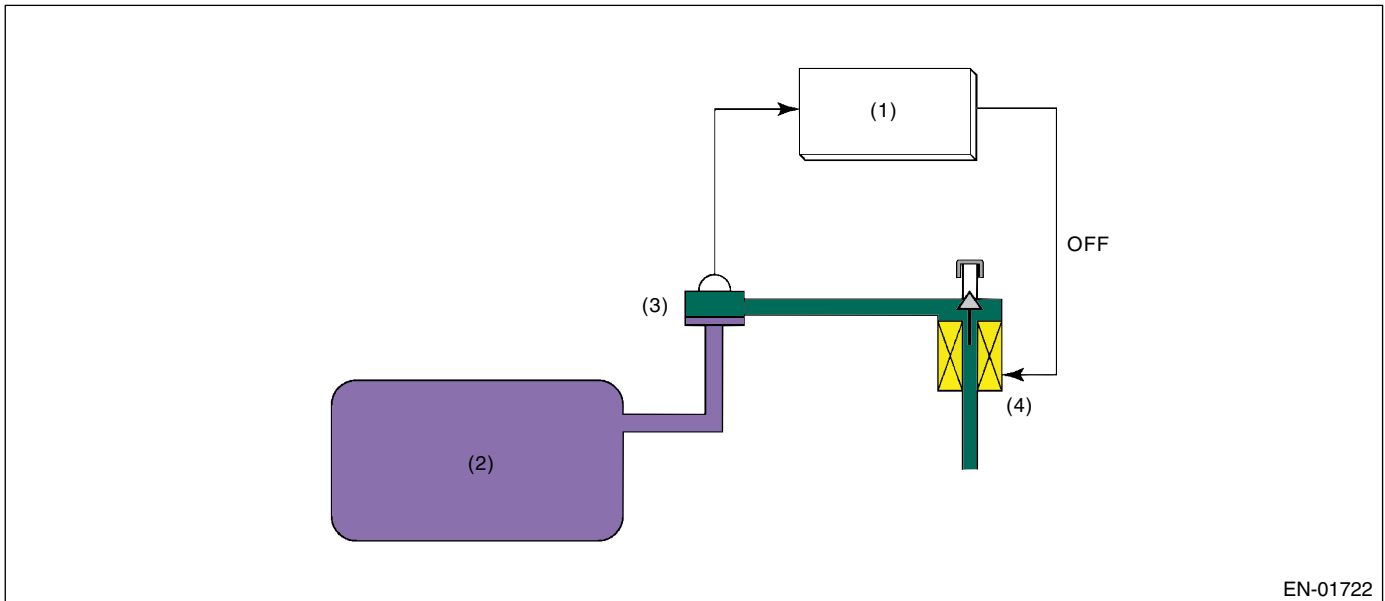

Diagnostic Trouble Code (DTC) Detecting Criteria

GENERAL DESCRIPTION

Purpose of this solenoid

Fuel tank pressure sensor detects the difference between the atmospheric air pressure and the tank pressure, and the ECM monitors the pressure difference.

Even if the tank pressure is constant, the atmospheric air pressure varies depending on the driving height, and the pressure signal transmitted to ECM will change.

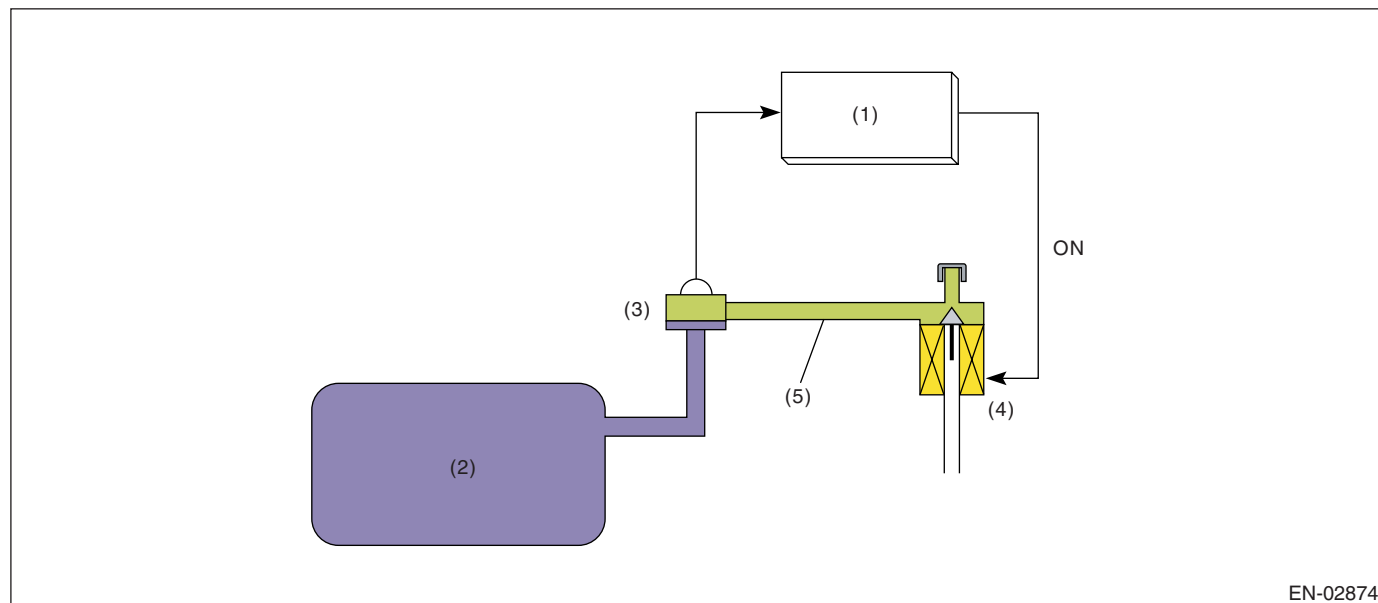

EN-01722

- (1) Engine control module (ECM)
- (2) Fuel tank
- (3) Fuel tank pressure sensor
- (4) Fuel tank sensor control valve

Diagnostic Trouble Code (DTC) Detecting Criteria

GENERAL DESCRIPTION

Especially, in the small leakage [0.5 mm (0.02 inch)], minute change in the tank pressure has to be detected. This diagnosis period is long (approx. 29 seconds). And if the driving height changes during the diagnosis, the atmospheric air pressure changes. In this case, it becomes difficult to precisely detect the tank pressure variation, causing erroneous diagnosis. Therefore, using the fuel tank sensor control valve, atmospheric air is sealed between the fuel tank pressure sensor and fuel tank sensor control valve, maintaining the air pressure constant and enabling the detection of minute variation of tank pressure.

- (1) Engine control module (ECM)
- (2) Fuel tank
- (3) Fuel tank pressure sensor
- (4) Fuel tank sensor control valve
- (5) Constant pressure

NOTE:

ECM also has the atmospheric air pressure sensor, and always monitors atmospheric air. However, as the monitoring range is large, that is, 53.3 to 107 kPa (400 to 800 mmHg, 15.7 to 31.6 inHg), it is not suitable for detection of minute pressure variation.

In the case of small leakage diagnosis, the tank pressure variation is very small, that is, 0.13 to 0.26 kPa (1 to 2 mmHg, 0.04 to 0.08 inHg), and the fuel tank pressure sensor is equipped.

Diagnostic Trouble Code (DTC) Detecting Criteria

GENERAL DESCRIPTION

Abnormality Judgment

If OK judgment cannot be made, extend Mode Z 16 seconds more, and judge NG when all the criteria below are completed in 16 seconds.

Judgment Value

Malfunction Criteria	Threshold Value	DTC
(Tank pressure 1 second after Mode Z started) – (Tank pressure when Mode Z finished)	> 0.6 kPa (4.5 mmHg, 0.18 inHg)	P0457

Time for no fuel rolling of 3 ℓ or more	≥ 35 seconds	

Time Needed for Diagnosis: 16 seconds

- $evptezini \leq 0.91 \text{ kPa (6.8 mmHg, 0.27 inHg)}$
- Period without 3 ℓ (0.79 US gal, 0.67 Imp gal) or more fuel waving is 35 seconds or more.

Diagnostic Trouble Code (DTC) Detecting Criteria

GENERAL DESCRIPTION

• Leakage Diagnosis

DTC

P0442 Evaporative Emission Control System Leak Detected (Small Leak)

P0456 Evaporative Emission Control System Leak Detected (Very Small Leak)

P0457 Evaporative Emission Control System Leak Detected (Fuel Cap Loose/Off)

• Diagnostic Method

- The diagnostic method consists of creating a sealed vacuum in the fuel tank and then determining the presence of leakage from the speed at which the tank internal pressure returns to atmospheric pressure.

- The diagnosis is divided into the following five phases.

Mode A; (Estimation of evaporation abundance)

Calculate the tank pressure variation amount (P1) at Mode A. Move to Mode B after calculating P1.

Mode B; (Seal negative pressure)

Introduce the negative pressure of the intake manifold into the tank.

Approx. 0 → -1.4 kPa (0 → -10.5 mmHg, 0 → -0.41 inHg) (0.04-inch diagnosis)

Approx. 0 → -3.05 kPa (0 → -22.875 mmHg, 0 → -0.9 inHg) (0.02-inch diagnosis)

Move to Mode C when reaching the pressure above (target pressure).

Then, if the tank pressure does not become negative, judge that there is large leakage in the system. In 0.04-inch diagnosis, judge that there is large leakage (10 seconds or 25 seconds) and terminate the EVAP. diagnosis. In 0.02-inch diagnosis, cancel the diagnosis (20 seconds).

Abnormality Judgment

Judge NG (large leakage) when the malfunction criteria below is completed.

Judgment Value

Malfunction Criteria	Threshold Value	DTC
(0.04-inch diagnosis) Period until reaching target negative pressure OR, Mode B period (Tank Pressure Min. Value in Mode B) – (Tank Pressure when starting Mode B)	≥ 25 seconds ≥ 10 seconds ≥ -0.53 kPa (-4 mmHg, -0.16 inHg)	P0457

Mode C; (Check increasing pressure)

Stop the introduction of negative pressure. (Wait until returning to the start level of P2 calculation)

When returning to the start level of P2 calculation, move to Mode D.

Judge premature OK and move to Mode E when not returning in the determined period of time.

	Tank pressure when P2 calculation started	Premature OK Judgment Period
0.04-inch Diagnosis	-1.30 kPa (-9.75 mmHg, -0.38 inHg)	15 seconds
0.02-inch Diagnosis	-3.00 kPa (-22.5 mmHg, -0.89 inHg)	20 seconds

Mode D; (Measurement of negative pressure variation)

Monitor the tank pressure variation in Mode D. In this case, the tank pressure increases (close to atmospheric pressure) because the evaporator is generated. However, if there is leakage, the pressure increases additionally. P2 means the variation amount of this tank pressure. After calculating P2, perform the small leakage diagnosis.

When Terminating Mode D

By assigning the variation values of tank pressure, P1 and P2, in the following formula, judge the system small leakage. If the calculated judgment value is larger than the threshold value, judge that there is a failure. 0.04-inch Diagnosis

Judge NG when the malfunction criteria below is completed.

CA:DTC P0705 TRANSMISSION RANGE SENSOR CIRCUIT (PRNDL INPUT)**1. OUTLINE OF DIAGNOSIS**

Judge NG when the “D” range switch becomes ground short or open circuit.

2. COMPONENT DESCRIPTION

Inhibitor switch ensures the safety at engine start. This switch is installed to the right side of transmission case, and operated by selector lever. When the selector lever is in the “P” or “N” range, the engine will start because the electric circuit in inhibitor switch is closed and the starter circuit is connected. When the selector lever is in the “R”, “D”, “3”, “2” or “1” range, the electric circuit in inhibitor switch is open; therefore, the engine cannot be cranked. In the “R” range, the back-up light will illuminate because the back-up light circuit in the switch is connected. In addition to the functions above, the inhibitor switch has the circuit which detects the selected range position at the present and transmits the range signal to the TCM.
